Daily practice draft automation

Run `python automation/daily_draft.py --day 1` from the repository root. Choose any day 1–28. Open the resulting .eml file locally, review its contents, and add a recipient manually if desired. This script neither connects to an email account nor sends anything. It uses a template, not a live AI API. Generation of the code was AI-assisted; daily generation is deterministic.

Existing files are not overwritten. Choose a different `--out` directory for a repeat demonstration. Do not commit personal email addresses, credentials or learner records. Schedule execution only after understanding the script; scheduling is optional and is not claimed to be configured.
