Prompt library

These are reusable templates, not a fabricated transcript of prompts already submitted to other tools. Save actual prompts, responses and dates in your evidence folder.

1. Research

Find research on novice programming misconceptions. Return author, title, year, DOI, supported claim and limitation. Distinguish a full-text finding from an abstract summary.

2. Cross-check

Check these sources and claims independently. Flag fabricated titles, unresolved DOIs and claims not supported by the source. Do not invent missing evidence.

3. Learning design

Design 28 thirty-minute sessions for first-year CSE learners with no programming background. Include retrieval, a small example, independent practice and reflection. State prerequisites.

4. Patient tutor

Act as a patient Python tutor. Ask me to predict the output first. Give only one hint at a time. Do not reveal a complete answer until I attempt the task or explicitly request it.

5. Misconception diagnosis

Here is my code, expected output and actual output: [insert]. Identify whether the difficulty is syntax, conceptual understanding or strategy. Ask one diagnostic question before explaining.

6. Practice

Create a beginner exercise with a precise input contract, normal case, boundary case and invalid-input behavior. Do not include its solution in the first response.

7. Verification

Review this solution against its contract: [insert]. Identify counterexamples and produce tests. Do not claim code was executed unless it actually was.

8. Quiz design

Draft 15 beginner Python questions aligned with these outcomes: [insert]. Include short rationales and an unambiguous scoring key.

9. Presentation

Create exactly six introductory slides from this research summary. Do not add unsupported learning-gain percentages. Put source credit on relevant slides.

10. Automation

Write a standard-library script that converts one CSV plan row into a local .eml draft. Never send email, never request passwords and refuse overwriting existing drafts.

11. Responsible AI

Audit this project for copied text, personal data, unsupported claims and unverified code. Separate completed actions from proposed actions.

12. Reflection

Compare these real pre/post results: [insert]. Calculate change without inventing data and explain why the comparison does not establish causation.
