Verification report

Actual execution

- Runtime: Python 3.12.8.
- Command: `python -m unittest discover -s tests -v`.
- Exit status: 0; all discovered tests passed. Full output: test_output.txt.
- Twenty solution functions exercised with ordinary and boundary examples; applicable invalid inputs tested.
- Automation checked across all 28 days, rejected days 0 and 29, and refused overwriting.
- Mini-project run with oops, 50, 100, done; rejected invalid input and produced average 75.00.
- All 10 Python blocks from the article executed successfully.
- Article length: 1000 whitespace-separated tokens, including headings and code. This transparent counting method may differ from a word processor's prose-only count.

AI-output audit

Claim or risk	Check	Result
Official tutorial is a complete absolute-beginner curriculum	Read tutorial audience description	Rejected; extra scaffolding added
range includes its stop value	Boundary tests and code tracing	Rejected; stop is excluded
input automatically returns an integer	Explicit conversion in examples	Rejected
eval is appropriate for numeric input	Security review	Rejected; int with ValueError handling used
Printed output is equivalent to a returned result	Function examples and tests	Rejected
Newest Python release is required	Review syntax and runtime record	No such requirement claimed
Daily email generation sends mail	Review standard-library draft code	Local files only; no network calls
Student learning gains are already measured	Review before/after document	No; data remains uncollected
Four AI tools have already been used	Review evidence log	No; requirement remains open

Limitations

Passing tests does not prove correctness for all possible inputs. Contracts constrain input types; functions are educational examples, not production APIs. CI configuration is supplied but has not run on GitHub here. Local tests ran only on the runtime above; matrix compatibility is not represented as already verified. No live connector, actual email delivery, original-paper full-text review, learner evaluation or additional AI-tool session was performed.

Student repeat-check

Run the test command after every code change. Save your actual output and version. If you change task contracts, update the solutions, tests, quiz and plan consistently. Verify source currency and DOI metadata yourself before final academic submission.
